color-blindness (kul'or-blind\*nes), n. Incapacity for perceiving colors, independent of the capacity for distinguishing light and shade, and capacity for distinguishing light and shade, and form. It is not a mere incapacity for distinguishing colors (for this night be due to want of training), but an absence or great weakness of the sensations upon which the power of distinguishing colors must be founded. Color-bilindness may be total, that is, the absence of all perception of colors as such, independently of light and shade, all colors appearing simply as shades; or partial, the entire or partial inability to distinguish particular colors independently of difference of light and shade. The most common form of the latter defect is the inability to perceive red as a distinct color, red objects being confounded with gray or green, and next in frequency is the Inability to perceive green. The color which to a normal eye is complementary to the defective color appears as gray; and a mixture of white and black (gray) of the proper luminosity certainly cannot be distinguished by the color-

blind from the defective color (red or green). The results of statistical inquiries as to the prevalence of color-blindness show its existence in from 2 to 6 per cent. of males, while among women the number of cases seems to be considerably under 1 per cent. Also called dultonism and achromatosia

[\langle F. combustion = Sp. combustion = Pg. combusta = It, combustione, \langle LL. combustio(n-), \langle L. combustus, pp. of comburere, burn up: see combust, a.] 1. The action of fire on inflammable materials; the act action of fire on inflammable materials; the act or process of burning. Chemically considered, combustion is a process of rapid oxidation caused by the chemical union of the oxygen of the air, which is the supporter of combustion, with any material which is capable of oxidation—that is, combustible. It results in the formation of oxygen compounds, some or all of which may be gaseous and therefore invisible, and in the liberation of energy, which is made evident by a rise of temperature and often by flame or incandescence. The weight of the products of combustion is always precisely equal to the sum of the weight of the burned substance and that of the oxygen used in the burning. The energy set free is also precisely the same as that which would be required to separate the oxygen gain from its combinations. In common life oxygen is the sole supporter of combustion. In the laboratory iodine, chlorin, and some other substances also perform a similar office ic certain cases. The term combustion has also been applied to slow processes of oxidation not attended by high temperature or evolution of light, such as the combustion in the body which keeps up the animal heat, and the slow decomposition of animal and vegetable matter in the air. See eremacausis.

The compression of air renders the combustion of gase-

See eremacausis.

The compression of air renders the combustion of gaseous matter less perfect, and, . . . within certain limits at least, the more rarefied the atmosphere in which flame burns, the more complete its combustion.

E. Frankland, Exper. in Chem., p. 901.

Any chemical action whatsoever, if its energy rise sufficiently high, may produce the phenomenon of combustion, by heating the body to such an extent that it becomes luminous.

Spontaneous combustion, the ignition of a body by the internal development of heat without the action of an external agent. It not infrequently takes place in heaps of rags, wool, or cotton soaked with oil, and it masses of wet coal. In the first ease it is caused by the rapid spontaneous oxidation of oil, which raises the temperature sufficiently to make it burst into tlame; in the second case a

similar rapid exidation of the suiphur of pyrites contained in coal causes an increase of heat sufficient finally to ig-nite the coal. See flame.

One of a class of celestial bodies which move about the sun in greatly elongated orbits, usually elliptical or in greatly elongated orbits, usually elliptical or parabolic. The typical comet, as it approaches the sun, has the appearance of a bright star-like point (the nucleus) surrounded by a mass of misty light (the coma), which is

extended away from the sun into a stream of light (the tail) reaching a length of from 2° to 90°. Comets which follow a parabolic orbit appear but once, their orbit being infinite, and are called parabolic comets; those moving in ellipses return periodically, and are called periodic comets. The fact of the periodicity of some comets was first established by Halley with reference to the comet of 1682. The paths in which they move are not, like those of the planets, all nearly in the same plane as the orbit of the earth, but are inclined to that orbit at all angles; and their motion along their paths, though generally direct, that is, in the same direction as that of the earth and the other planets, is sometimes retrograde. Some comets have no nucleus; and this is the case with every one while it is still every remote, when it appears as a mere nebulous patch. In this state it is called a telescopic comet. As it approaches the sun, the nucleus is gradually formed as a central but not sharply defined point of light; later, the tail, consisting of vaporous matter driven back by some repellent influence of the sun, often with enormous velocity, is formed; and lastly, if the comet is a bright one, a series of bright envelops rise successively from the nucleus, each extending back into the tail, and gradually disappearing. The matter of which comets are composed is so transparent that the faintest stars are seen through them without the slightest diminution of their luster. Of their physical constitution little is definitely known. The most remarkable discovery of recent times regarding them is the identity of the course of some of them with the orbit of certain showers of shooting stars. This was first demonstrated by the Italian astronomer Schiaparelll, who proved the sgreement between the orbit of the great comet of 1862 and that of the star-shower seen annually shout August 1st-10th. Very remarkable comets appeared in 1456, 1680, 1811, 18

They committed themselves unto the sea. Acts xxvii, 40, (b) To speak or act in such a manner as virtually to bind one's self to a certain line of conduct, or to the approval of a certain opinion or course of action: as, he has committed himself to the support of the foreign policy of the government; avoid committing yourself.

It might, perhaps, be in the power of the embassador, without committing himself or his government, to animate the zeal of the Opposition for the laws and liberties of England.

Macaulay, Hist. Eng., vi.

To commit to memory, to learn by heart; memorize.

Syn, I. Intrust, Confide, Commit, Consign, agree in general in expressing a transfer from the care or keeping of one to that of another. To intrust is to give to another intrust, to put into another's are with confidence in him. Confide is still more expressive of trust or confidence, especially in the receiver's discretion or integrity; the words now used most of secrets, but may be used more widely. Commit implies some measure of formality in the act; it is the most general of these words. Consign implies still greater formality in the surrender: as, to consign goods to a person for sale; to consign the dead to the grave. To consign seems the most final as an act; to commit stands next to it in this respect.

But a case may arise, in which the government is no longer sale in the hands to which it has been intrusted.

Select committee, a committee appointed to consider and report on a particular subject.—Standing committee, a permanent committee, as of a legislature, society, etc., intended to consider all matters within an appointed sphere. In the Congress of the United States and in the State legislatures the system of standing committees prevails. There are about 40 such committees in the United States Senate and about 50 in the House of Representatives, consisting of not less than 3 members, and, except in a few cases, not more than 15. The most important committees of the Itouse are the Committee on Ways and Means, which doals with taxes, customs, and all other revonues of the government, and the Committee on Appropriations, in which the principal appropriation bills originate. Each house has also certain select committees, but they are not important. All bills introduced into either branch of Congress, and the estimates for the needed appropriations for the different executive departments, are referred to their appropriate committees, examined, and tavorably or adversely reported to the flouse or Senate.

F. commodore is from E.] 1. An officer in the navy next in rank below a rear-admiral and above a captain. In the navy of the United States (in which the office was first created in 1862) a commodore ranks with a brigadier-general in the army, and may command a division or a squadron, or be chief of staff of a naval force commanded by an admiral or a vice-or rear-admiral; or he may command ships of the first class, or naval stations. In the British navy the rank of commodore is a temporary one, and of two kinds, of which the first conveys authority over a captain in the same ship, while the second does not. The former gives the rank, pay, and allowances of a rear-admiral; the latter, the pay and allowances of a captain. They both carry distinguishing pennants. Abbreviated Com.

Specifically—2. The freemen of England as

organized in their early shires, municipalities, and guilds; the represented people.

The three estates of clergy, lords, and commons finally emerge as the political constituents of the nation, or, lutheir parliamentary form, as the tords spiritual and temporal and the commons. This familiar formula in either

shape bears the impress of history. The term commons is not in itself an appropriate expression for the third estate; it does not signify primarily the simple freemen, the plebs, but the plebs organised and combined in corporate communities, in a particular way for particular purposes. The commons are the "communitates" or "universitates," the organised bodies of freemen of the shires and towns; and the estate of the commons is the "communitas communitatum," the general body into which for the purpose of parliament those communities are combined. The term, then, as descriptive of the class of men which is neither noble nor clerical, is drawn from the political vocabulary, and does not represent any primary distinction of class.

Stubbs, Const. Hist., § 185.

Men . . . served and praised God by communion and in public manner.

Close communion, among Baptists, communion in the Lord's supper with faptists only: a practice based on the belief that all who have not received baptism by immersion are in reality unbaptized, and hence not entitled to communion. Those who hold this belief are called close-communion Baptists, or close-communionists, in distinction from snother class of Baptists opposed to it, and hence called open-communionists. The former prevail in the United States, and the latter in Great Britain.—Communion anthem or hymn, an anthem or hymn sung after the canon or prayer of consecration and before or during the communion of priest and people. In the early church, when all the faithful not under discipline communicated as a rule every Sunday, several psalms or hymns with antiphons seem to have been sung at this time. Survivals of this are seen in the Western communio and in the koinonikon of the Greek Church. The 34th psalm was especially thus used in primitive times, and its eighth verse as an antiphon, "O taste and see," as also in the Mozarable Hungy. In the Anglican prayer-book of 1549 the Agnus is directed to be sung during the communion of the people. In the American prayer-book of 1549 the Agnus is directed to be sung during the communion of the becad and wine used in the sacrament of the Lord's supper.—Communion in one kind. communism (kom'ū-nizm), n. [< F. communisme, < commun, common, + -isme: see common, commune<sup>2</sup>, n., and -ism.] 1. An economic system, or theory, which rests upon the total or partial abolition of the right of private propagation of the propagation of the right of private propagation. erty, actual ownership being ascribed to the community as a whole or to the state. The right community as a whole or to the state. The right of the state to control the means of production, and also the distribution and consumption of the products of industry, is in general especially emphasized by the advocates of the theory. In some communistic schemes the right of the individual to the control of his own labor is also denied, each one being required to do that which is most advantageous to the community as a whole. Such theories, differing in details, have frequently been advanced—by Plato in his "Republic," by Sir Thomas More in his "Utopia," and in recent times by many writers—and have not infrequently been carried into execution on a small scale, as in the Oneida Community. See community.

Communism, in its ordinary signification, is a system or form of common life in which the right of private or family property is abolished by law, mutual consent, or vow. To this community of goods may be added the disappearance of family life.

Woolsey, Communism and Socialism, p. 1.

Communism is the name that has been given to the schemes of social innovation which have for their starting-point the attempted overthrow of the institution of private property.

Energy. Brit., VI. 211.

The machinery of Communism, like existing social machinery, has to be framed out of existing human nature; and the defects of existing human nature will generate in the one the same evils as in the other.

doctrines of communism.

All communists without exception propose that the people as a whole, or some particular division of the people, as a village, or commune, should own all the means of production—land, houses, factories, railroads, canals, etc.; that production should be carried on in common; and that officers, selected in one way or another, should distribute among the inhabitants the fruits of their labor.

R. T. Ely, French and German Socialism, p. 35.

Discordant theories range from the doctrines of the communist, who would overturn our social structures, to those of the timid, half-hearted believers in our government, who wish to go back to restraints and powers exerted by the monarchs of Europe.

N. A. Rev., CXXVII. 360.

2. An advocate of communalism; a member of a commune; a communalist.—Bible Communist. See Perfectionist.

communistic (kom-ū-nis'tik), a. [< communist

3. A number of people associated together by the fact of residence in the same locality, or of subjection to the same local laws and regulations; a village, township, or municipality.

The sympathetic or social feelings are not so strong he-tween different communities as between individuals of the same community. Calhoun, Works, I. 9.

With them (the Slavic nations] the rule of the free-dom of acquests has heen less strictly observed than in other European countries, and with them, accordingly, the community continues in its fullest vigor.

W. E. Hearn, Aryan Household, p. 240.

A great many of the manors now or formerly existing represent ancient communities in which, little by little, the authority of the community was engrossed by the most considerable man in it, until he became the lord, and the other landholders became his dependents.

F. Pollock, Land Laws, p. 41.

4. A society or association of persons having common interests or privileges, commercial, social, political, or ceclesiastical, and subject to the same regulations; now, especially, a society of this nature in which the members reside together or in the same locality: as, the Oneida Community (see below).

According to the "Rules and Orders of the Clothiers' Community, 1803," the chief object of the Institution was to carry out the legal regulations as to apprentices in their original purity. English Gilds (E. E. T. S.), p. clxxv.

comparator (kom'pā-rā-tor), n. [\langle LL. comparator, a comparer, \langle L. comparator, parator, a comparer, \langle L. comparator, pp. comparator, comparer see comparer, v.] An apparatus for making comparisons; especially, an apparatus for making comparisons; especially, an apparatus for making comparisons. instrument for comparing the lengths of nearly equal bars, either from end to end or between lines engraved upon them. The usual optical comparator has two microscopes, firmly attached to a bar or something of that sort, with their focal planes coincident and furnished with filar micrometers, whose screws lie virtually in one right line. There is also a carriage moving at right angles to the screws, so as to bring first one bar and then another under the microscopes. In Saxton's comparator a beam of light is caused to fall on a mirror delicately supported on its axis, round which a very fine chain is wound, the other end being attached to a lever provided with a spring in such a way that the mirror taturned one way or the other as the bar contracts or expands, or is replaced by a shorter or longer bar. The mirror throws the beam upon a large scale at some distance, where it indicates by a large movement the very minute movements of the mirror. One form of color-comparator employs a glass prism, which may be filled with a colored liquid, and a series of glass tubes containing colored solutions of known tints and shades. equal bars, either from end to end or between

=Syn. Compare, Compare to, Compare with, Controst. Two things are compared in order to note the points of resemblance and difference between them; they are contrasted in order to note the points of difference. When one thing is compared to another, it is to show that the first is like the second, as, in Luke xv., the sinner is compared to a lost sheep, etc.; when one thing is compared with another, it is to show either difference or similarity, especially difference: as, the treatment of the Indians by Penn may be compared with the treatment of them by other colonists of America. Compare and contrast imply equality in the things examined; compare to and compare with do not, the object of the verb being the principal subject of thought.

5. In gram., the variation of an adjective or (much more rarely) adverb to express a higher and the highest degree of what is denoted by the adjective or adverb. The degrees expressed thus in English, and in most of the languages related with English, are three (including as first the primitive word): positive (so called by sutthesis to the others), as strong, teek, often; comparative, as stronger, veaker, oftener; and superlative, as strongest, veakest, oftener. Adjectives not admitting this variation, and many adverbs, express like degrees by prefixing the comparative adverbs more and most; as, more glorious, most glorious; more veakly, most veakly; and such phrases often receive, less properly, the same names as the forms of equivalent value.

Chaucer, House of Fame, 1. 462.

7. An instrument used to indicate the magnetic 7. An instrument used to indicate the magnetic meridian, or the direction of objects with reference to that meridian. The mariners' or ship's compass consists of three parts, viz., the bowl, the card, and the needle. The bowl, which contains the eard and needle, is usually a hemispherical brass receptacle, suspended by two concentric brass rings (called ginbuls) in such a manner that the bowl is kept in a horizontal position, notwithstanding the motion of the ship. The circular card is divided into 32 equal parts by lines drawn from the center to the circumference, the points of intersection with the circumference (or the radial lines, or rhumbs, themselves) being called the points of the compass. The intervals between the points are also divided into 360 degrees; consequently, the angle between any two adjoining points is 11'15'. The four principal divisions (dividing the circumference into four equal parts) are called the eardinal points, viz., north, east, south, and west. The names of the others are compounded of these; and if the direction or bearing referred to lies between any two points, quarter or half points are added, as N. E. by E. ½ E.; or it is expressed in degrees, as south 42' west. The needles, of which there are generally from two to four, fastened to the bottom of the card, consist either of laminee or layers of hardened steel or of bundles of steel wire. In the center of the card is a conical socket poised on an upmeridian, or the direction of objects with ref-

ter of the card is a conical socket poised on an upright pin fixed in the bottom of the bowl, so that the card hanging on the pin turns freely round its center. On shipboard the compass is so fixed that a black mark, called the lubber's line, coincides with an imaginary line parallel to the keel of the ship, and the point of the compass-card which is directly against this line indicates the direction of the ship's head. The indication is, however, subject to a certain modification, owing to the variation of the magnetic meridian (see variation) and the deviation of the compass, under deviation). The regulation compass in the United States navy, and the one also used on many mail-steamers, is known as Ritchie's liquid compass, in which the card is a skeleton, and the bowl, having a glass top, after being filled with a fluid composed of about one third alcohol and two thirds water, is hermetically sealed.

composing-machine (kom-pō'zing-ma-shēn'), n. A type-setting machine. The earliest composing-machine, invented by William Church in 1821, attempted to make the types as well as set them. This special and instantaneous making of the types is also the basis of more recent inventions; but most composing-machines are constructed to set types previously made. The types are specially grooved or nicked to fit them for being seized automatically. The arrangement of classified types in separate channels, and their dislogment in order into a larger channel by means of levers touched from a finger-board, are features common to most composing-machines, widely as they may differ in other details of construction. Few of these machines have come into practical use, owing especially to the difficulty of separating or distributing the types by an automatic process in the special manner required.

and arranges the types that he picks out of the cases with his right hand. The composing-stick is fitted with a knee, adjustable, by means of a screw or a clamp, to any length of line required in printed work. The earliest composing-sticks were sticks of wood, with knees specially tacked on for different lengths of line; but wooden sticks are now used only in setting hand-bills, or for other work requiring very long lines.

Compositæ¹ (kom-poz'i-tê), n. pl. [NL., fem. pl. (sc. L. plantæ, plants) of L. compositus, composite: see composite.] The largest natural order of plants, including over 750 genera and 10,000 specios, distributed all over the globe wherever vegetation is found, and divided equally between the old world and the new. They form about a tenth of all phenogamous plants, an eighth of those of North America, and in some regions even a larger proportion. They are herbs, or much more rarely shrubs, scarcely ever arborescent, and are of comparatively slight economic importance. A few species are cultivated for food, as the artichoke (Cynara), the salisity (Trapopoon), and the lettuce (Lactua); others have useful medicinal properties; and a very large number are cultivated for ornament. The flowers are gamopetalous and mostly pentamerous, sessile in a close head (the compound flower of early botanists, whence the name of the order), and surrounded by an involucre of separate or connate bracts. The ovary is inferior and one-celled, and becomes an achene in fruit, the calyx-limb being reduced to a circle of hairs, awns, scales, or teeth, called the pappus. The stamens are inserted on the corolla, and their authers are united into a tube, on which account the name Symantheree has been sometimes given to the order. The genera of the order are divided into three series, depending upon the character of the corolla, viz.: (t) the Labitate force (or Mutsiacee, of 59 genera, largely bouth American), having a bilabiate corolla, at least in the perfect flowers; (2) the Liguitipone (or Citoriaceea

quality of being capable of compression into a smaller space or compass: as, the compressibility of elastic fluids. The compressibility of hodies arises from their porosity; when a body is compressed into a smaller bulk, the size of its porea is diminished, or its constituent particles are brought into closer contact, while its quantity of matter remains the same. All bodies probably are compressible in a greater or less degree. Those hodies which return to their former shape and dimensions when the compressing force is removed are said to be elastic. conaria, n. Plural of conarium.

conarial (kō-nā'ri-al), a. [< conarium + -al.]

Of or pertaining to the conarium, or pineal body of the brain.— Consrial fossa, a depression of the roof of the skull of some suimals, in which the conarium is lodged.— Conarial tube, the more or less extended cavity or canal of the pineal body, now commonly supposed to be the remnant of the passage by which in vertebrates generally the primitive cavity of the myelencephalon communicated with the outer surface of the head. In man and the higher vertebrates generally the consrium appears to be deep-seated in the brain; but this is deceptive, and merely owing to the overgrowth of the cerebrum. The conarium is morphologically on the superior surface of the brain, whatever its apparent situation, and there is much reason to suppose that the large openings of the top of the skull in sundry Tertiary numnals, called the parietal foramina, indicate the extension of the conarian tube to the surface, and the formation there of a visual or other special-sense organ. On this view, the conarium is the vestige of an extinct eye. See conarium.

conario-hypophysial (kō-nā "ri-ō-hī-pō-fiz'-i-al), a. [< conarium + hypophysis + -al.] In anat, pertaining to the conarium and to the hypophysis of the cerebrum, or to the pineal and rituitary bodies.

hypophysis of the cerebrum, or to the pineal hypophysis of the cerebrum, or to the pineal and pituitary bodies. An epithet applied by Sir R. Owen to a tract through which these two structures are placed in communication in the embryo, the conario-hypophysial tract being primitively a part of the general cellan cavity of the brain.

Dryden, Art of Poetry, iii, 475.

Dryden, Art of Poetry, iii, 475.

When we do our utmost to conceive the existence of external bodies, we are all the while only contemplating our own ideas. But the mind, taking no notice of itself, is deluded to think it ean and doth conceive bodies existing unthought of or without the mind; though at the same time they are apprehended by or exist in itself.

By. Berkeley, Human Knowledge, § 23.

To conceive a round square, or to conceive a body all hlack and yet all white, would only be to conceive two different sensations as produced in us simultaneously hy the same object; a conception familiar to our experience; and we should probably be as well able to conceive a round square as a hard square, or a heavy square, if it were not that, in our uniform experience, at the instant when a thing begins to be round it ceases to be square, so that the beginning of the one impression is inseparably associated with the departure or cessation of the ether.

J. S. Mitt.

We cannot conceive an individual without in the same act implying a class to which it belongs, and a larger class from which it is distinguished.

G. H. Lewes, Proba. of Life and Mind, H. il. § 14.

Macaulay, History.

=Syn. Concise, Succinct, Condensed, Laconic, Summary, Compendious, short, terse, pithy, sententious, compact. The first four imply fullness of meaning as well as great brevity; the next two that the subject is treated by exhibiting only its main heads, and that therefore the treatment is comparatively brief. Concise frequently refers to style, and signifies the expression of much in few words; succinct is generally applied to the matter, the less important things being omitted: thus, a concise style or phrase, but a succinct narrative or account. Condensed relates more to the mode of treatment by which a matter is brought or compressed into a smaller space than it might have occupied. Laconic is applied to expressions which carry conciseness or brevity to an extreme. A summary account gives the principal points in the case; a compendious account is more sure than a summary account to give a complete and sufficient view of the subject.

His [Lord Mahon's] narration is very perspicuous, and is

doubt; finally deciding; leading to a conclusion or determination.

The agreeing votes of both houses were not, by any law or reason, conclusive to my judgment. Eikon Basilike.

There is very strong evidence, although it is not conclusive, that in a given gas—say in a vessel full of carbonic acid—the molecules are not all of the same weight.

W. K. Clifford, Lectures, 1, 208.

2. Specifically, bringing about or leading to a logical conclusion; conforming to the rules of the syllogism.

Men . . . not knowing the true forms of syllogisms cannot know whether they are made in right and conclusions of the property of the control sive modes and figures.

cannot know whether they are made in right and conclusive sive modes and figures.

3. In law, possessing such weight and force as not to admit of contradiction.—Conclusive evidence, in law, evidence which precludes further contradiction of the fact in question; evidence which, if not disproved, precludes dispute on the point it is adduced to prove. Thus, a judgment for a debt is said to be conclusive evidence of the indebtedness it establishes, because, having been put in evidence against the debtor, he cannot usually give other evidence merely in denial of the indebtedness, unless he first gives evidence sufficient to avoid the judgment. Such evidence is said to raise a conclusive presumption of the fact it is adduced to prove. The phrase conclusive evidence is also used, more loosely, of evidence which, though not necessarily conclusive, yet, not having been contradicted, is sufficient as matter of law to oblige a jury to come to the proposed conclusion. =Syn. I. Ecentual, Ultimate, etc. (see final), convincing, decisive, unanswerable, irrefutable.

conclusively (kon-klö'siv-li), adv. In a conclusive manner; decisively; with final determination: as, the point of law is conclusively settled.

3. In music: (a) The simultaneous combination of tones that are in tune or in harmony with each other: opposed to discord.

The true concord of well-tuned sounds.

Shak., Sonnets, viii. (b) Specifically, a simultaneous combination of two or more tones, which has a final and satisfactory effect when taken alone, without satisfactory effect when taken alone, without preparation or resolution. Concords of two tones (also ealled consonances) are either perfect or imperfect; perfect concords include primes, fourths, fifths, and octaves, and imperfect include major and minor thirds and major and minor sixths. Concords of more than two tones contain only the above intervals between every pair of their constituent tones; but the triad, consisting of the 2d, 4th, and 'th of the scale when the 2d is in the lowest voice, is ranked as a concord, notwithstanding the dissonance between the 4th and 7th. (See triad, and common chord, under chord, 4.) Concords of two tones are acoustically distinguished from discords by the simplicity of the ratios between the vibration-numbers of the tones; thus, the ratios of the above concords are 1, 3, 1, 7, 2, 2, 3, and § respectively. (See interval and consonance.)

At musicke's sacred sounde my fansies eft begonne in concordes, discordes, notes, and eliffes, in times of unisonne.

Boyle, Works, I. 544.

In gram. and logic, a concrete noun; a particular, individual term; especially, a classname or proper name.

Vitality and Sensibility, Life and Consciousness, are abstractions laving real concretes. They are compendious expressions of functional processes conceived in their totality, and not at any single stage.

G. H. Lewes, Frobs. of Life and Mind, I. il. § 2.

A compact mass of sand, gravel, coarse pebbles, or stone chippings cemented together by hydraulic or other mortar, or by asphalt or rehydraulic or other mortar, or by asphalt or refuse tar. It is employed extensively in building under water (for example, to form the bottom of a canal or the foundations of any structure raised in the sea, as piers, breakwaters, etc.), and for pavements. The walls of houses are sometimes formed of it, the ingredients being first firmly rammed into molds of the requisite shape, and allowed to set. The finer kind of concrete used for purposes requiring the greatest solidity is known as beton (which see).

4. Sugar which has been reduced to a solid mass by evaporation in a concreter.

1. The act of growing together or becoming that the soul is generated at the same time as The act of growing together or becoming united in one mass; concrescence; coalescence. -2. A mass of solid matter formed by a growing together, or by congelation, condensation, coagulation, conglomeration, or induration; a clot; a lump; a nodule: as, "concretions of slime," Bacon.

These greedy flames shall have devoured whatever was combustible, and converted into a smoak and vapour all grosser concretions.

Glanville, Pre-existence of Souls, p. 178.

Calcareous Concretions from Clay-beds.

Specifically—3. In geol., an aggregation of mineral matter, usually calcareous or silicious, in concentric layers, so arranged as to give rise to a form approaching the spherical, but often to a form approaching the spherical, but offer much flattened. This often takes place about some or ganic nucleus, the decomposition of which seems in such cases to be the cause of the structure. Concretions are common in sandstones, shales, and clays.

4. In logic: (a) The state of being concrete; concreteness. (b) The act of determination, or of rendering a concept more concrete or determinate by adding to the marks it contains.

minate by adding to the marks it centains.

The mind surmounts all power of concretion, and can place in the simplest manner every attribute by itself. Harris, Hermes, iii. 1.

Gouty concretions, nodules of sodium urate formed in GOUTY CONCRETIONS, nodules of sodium trate formed in the tissnes of gouty persons.—Morbid concretions, in the animal economy, hard substances which occasionally make their appearance in different parts of the body, as pineal concretions, salivary concretions, hepatic concre-tions, etc.

In some Phallusie the alimentary canal is coated by a very peculiar tissue, consisting of innumerable spherical sacs containing a yellow concretionary matter.

Huxley, Anat. Invert., p. 518.

The tubular layer rises up through the pigmentary layer of the crab's shell in little papillary elevations, which seem to be concretionary nodules.

W. B. Carpenter, Micros., § 613.

Specifically — 2. In gcol., consisting of mineral matter which has been collected (either from

surrounding rock or from with-out) around some center, so as to form a more or less regu-

a more or less regularly shaped mass. Carbonate of lime deposited from hot aprings often displays the concretionary atructure in a high degree. In a single concretion all the parts are subordinate to one center; in a concretionary rock the whole mass is made up of more or less distinctly formed concretions.

concretism (ken'krē-tizm or ken-krē'tizm), n. [\( \) concrete + \( \) ism.] The habit or practice of regarding as concrete or real what is abstract or ideal.

It is a surprising instance of this tendency to *concretism*, that, among people so eivilized as the Buddhists, the most obviously moral beast-fables have become literal incidents of sacred history.  $E.\ B.\ Tylor$ , Prim. Culture, I. 374.

concretive (kon-krē'tiv), a. [= F. concrétif = Pr. concretiu; as concrete + -ive.] Causing to concrete; having power to produce concretion; tending to form a solid mass from separate particles: as, "concretive juices," Sir T. Browne, Vulg. Err.

concubinage (kon-kū'bi-nāj), n. [< F. concubinage, < concubine, eoncubine, + -age.] 1.
The act or practice of cohabiting without a legal marriage. In law it is a valid ground of objection against the granting of dower to a woman who has been a concubine, but is suing for dower as wife.

The bad tendency of Mr. Pope's "Eloisa to Abelard" is remarked by Sir John Hawkins . . . as depreciating matrimony and justifying concubinage.

Bp. Horne, Essaya,

2. The state of being a concubine. -3. In Rom. law [concubinatus], a permanent cohabitation, recognized by the law, between persons to whose marriage there were no legal obstaeles. It was distinguished from marriage proper (matrimonium) by the absence of "marital affection"—that is,
the intention of founding a family. As no forms were
prescribed in the later times either for legal marriage or
concubinace, the question whether the parties intended
to enter into the former or into the latter relation was
often one of fact to be determined from the surrounding
circumstances, and especially with reference to a greater
or less difference of rank between them.

4. A natural marriage, as contradistinguished
from a civil marriage, Bonvier.

The lady Anne did falsely and traitorously procure divers of the king's daily and familiar servants to be her adulterers and concubines. Indictment of Anne Boleyn.

2. A wife of inferior condition: one whose relation is in some respects that of a lawful wife, but who has not been united to the husband by the usual ceremonies: as, Hagar and Keturah, the concubines of Abraham. Such concubines were allowed by the Greek and Roman laws, and for many centuries they were more or less tolerated by the church, for both priests and laymen. The concubine of a priest was sometimes ealled a priestess. See concubinage, 3.

And he [Solomon] had seven hundred wives, princesses, and three hundred concubines. 1 Ki. xi. 3.

3. A woman who cohabits with a man without being married to him; a kept mistress.

I know I am too mean to be your queen, And yet too good to be your concubine, Shak., 3 Hen. VI., iii. 2.

Indeed, a husband would be justly derided who should bear from a wife of exalted rank and spotless virtue half the insolence which the King of England bore from concubines who owed everything to his bounty.

Specifically—(a) Any device for reducing gases or vapors to liquid or solid form. The reduction is usually effected by lowering the temperature of the vapor by contact with chilled surfaces. A form of condenser common in the laboratory is shown in the figure. From the flask, A, the vapor to be condensed escapes through the tube bc, which passes through a larger condenser-tube. A stream of feewater enters the condenser through d. and passes of through g, keeping the surface of the inner tube, bc, chilled, and the vapor gases and drops from c as a liquid. Condensers used to concentrate vapors or gases, as steam, alcoholic vapors, fumes, volatile H-quids, etc., commonly depend upon the reducing effects of a lower temperature. In them the vapor, gas, smoke, or fumes are brought into immediate contact with chilled surfaces. This is accomplished in a great variety of ways, as in the surface condenser of the steam-engine, the worm of a still, or the long convoluted tubes in which poisonous fumes or smoke are cooled before being allowed to escape to the chimney. The cooling surfaces are usually kept tool by water, as in the still, the gas-condenser, the sugar-condenser, etc. For fumes and smoke, the contact with walls exposed to the air is sufficient. (b) A part of a cotton-gin which compresses the lint for convenient handling. (c) In wool-manuf, a machine which forms the wool received from the doffer of a carding-engine or comber, and rolls it into slubbings. The doffer of the carding-engine is every a series of parallel strips of card-clothing, wrapped about the cylinder. The wool thus comes off in a number of loose flat ribbons of feece, which in the condensing-machine are carried by a leather apron beneath a roller which has a reciprocating notion thus comes off in a number of loose flat ribbons of feece, which in the condenser with the manufacture of sugar, the apparatus used for concentrating t

tuting a ground for a claim of reward.

Condignity and congruity (meritum de condigno and de congruo) are "terms used by the schoolmen to explain their peculiar opinions relative to human merit and descrying. The Scotists maintain that it is possible for man in his natural state so to live as to deserve the Grace of God, by which he may be enabled to obtain salvation, this natural fitness (congruitas) for grace being such as to oblige the Deity to graut it. Such is the merit of congruity. The Thomists, on the other hand, contend that man, by the divine assistance, is capable of so living as to merit eternal life, to be worthy (condignus) of it in the sight of God. In this hypothesis, the question of previous preparation for the grace which enables him to be worthy is not introduced. This is the merit of condignity."

8. In law: (a) A statement that a thing is or shall be, which constitutes the essential basis or an essential part of the basis of a contract or grant; a future and nncertain act or event not belonging to the very nature of the transaction, on the performance or happening of which the legal consequences of the transaction which the legal consequences of the transaction are made to depend. More specifically, a condition is a provision on the fulfilment of which depends the taking effect or continuance in effect of the instrument or some clause of it, or the existence of some right established or recognized by it, as distinguished from a covenant, which is a promise in a sealed instrument the breach of which may give rise to a claim for damages, but not necessarily the forfeiture of any right. The performance of a covenant, however, may be made a condition of the continued efficacy of the agreement. A condition precedent is a provision which must be fulfilled or an event which must accein before the instrument or clause affected by it can take effect. A condition subsequent contemplates that, after the instrument has taken effect, a right established or recognized by it may be extinguished by some future or uncertain event.

condor (kon'dor), n. [= D. G. Sw. condor =
Dan. kondor = F. condor, formerly condore =
It. condore, < Sp. Pg. condor, < Peruv. cuntur, a condor.] 1. A very large South American bird of prey, Sarcorhamphus gryphus, of the family Cathartidae or American vultures, having the head and upper part of the neck naked and largely carunculate, an exposed ruff of downy largely carunculate, au exposed ruff of downy white feathers round the neck, and the general plumage blackish, varied with much white in plumage blackish, varied with much white in the wings. The size of the condor has been greatly exaggerated; it is not known to exceed 9 feet in stretch of wings, and is little over 3 feet in total length. The bird inhabits chiefly the Andean regions, at elevations of from 10,000 to 15,000 feet above the sea, where it breeds, making no nest, but laying its eggs on the bare rocks. Condors are never seen in large companies, but in groups of three or four, and descend to the plain only when impelled by hunger. At such times two of them will successfully attack sheep, goats, deer, etc., though as a rule they prefer earrion.

B. Jonson, Case is Altered.

3. Transmission; conveyance; specifically, in physics, transmission of heat from points of high temperature to points of low temperature, high temperature to points of low temperature, or of electricity from points of high potential to points of low potential, from particle to purticle, and to a distance, by the raising of the temperature or potential of intermediate particles, without any sensible motion of them. It is distinguished from convection, by which heat and electricity are carried by moving particles; from the radiation of heat, which does not raise the temperature of the intermediate points (except so far as the radiation is hindered); and from the discharge and the electrolytic transfer of electricity.

Conduction [of heat] is the flow of heat through an unequally heated body from places of higher to places of lower temperature.

Clerk Maxwell, Heat, p. 10.

conductitious (kon-duk-tish'ns), a. conductitius, prop. icius, pertaining to hire, (conductus, pp. of conducere, hire: see conduce.] Hired; employed for wages.

action; deportment: as, laudable conduct; conductive (kon-duk'tiv), a. [=Sp. Pg. conductive); deportment: as, laudable conduct; conduct + -iec.] 1. Having the power or property of conducting: as, conductive bodies. See conductivity.—2. Resulting from conduction: as, the conductive discharge of electricity. conductivity (kon-duk-tiv'i-ti), n. [< conductive + -ity.] In physics, the power of conducting heat, electricity, or sound; the property of ing heat, electricity, or sound; the property of being conductive. In the case of heat (thermal conductivity) solids have in general a much higher degree of conductivity than liquids, and liquids than gases, the last being practically destitute of conductive power; both liquids and gases become heated by convection (which see), not by conduction. Furthermore, among solids the conductivity of metals for heat is greater than that of stony bodies, that of animal and vegetable substances being the least of all. Metals have also a relatively high degree of conductivity for electricity, a charge of electricity distributing itself freely over a metallic surface, and an electrical current passing more or less readily through a metallic wire. Those metals which are the best conductors of heat, as silver, copper, and gold, are also the best electrical conductors. The conductivity of many solids (glass, subplur, resin) is nearly zero for electricity; the same is true to a less degree of most liquids and also of gases. With any substance the conductivity for electricity is the reciprocal of the resistance. See resistance.

Conductivity varies not only with varying temperature, but also with varying tension, torsion, or pressure.

A. Daniell, Prin. of Physics, p. 564.

(a) A solid generated by the revolution of a
right-angled triangle upon one of its sides as
an axis. In the figure thus generated the base is a cir-

an axis. In the figure thus generated the base is a circle, and the line passing through the vertex and the center of the base (the axis) is perpendicular to the plane of the base; it is specifically termed a right cone. (b) A solid the surface of which consists of a circle, which forms its base, and the envelop of all the limited straight lines which join the circumference of the circle to a fixed point lying without the perpendicular to the circle from its center: the perpendicular to the circle from its center: specifically termed an oblique or scalene cone. See conic. (e) In modern gcom., any surface generated by a line one point in which is fixed. —2. Anything shaped like a cone. Specifically—(a) In bot., a dry multiple fruit formed of densely imbricate scales, as in the hop, but more especially in the pine, fir, and spruce, in which a pair of naked seeds is borne upon the upper side of each scale: technically called a strobile; in a more general sense, an inflorescence having a conelike shape. B'oolsey, Introd. to Inter. Law, § 104.

Articles of Confederation, in U. S. hist., the compact or constitution adopted by the Continental Congress in 1777 and ratified by the separate colonies within the next four years. The government formed under this compact, which went into effect on March 1st, 1781, was without an executive and judiciary, consisting simply of a congress of one house, in which each State had one vote; it was empowered to declare war and peace, make treaties with foreign powers, direct the land and naval forces in time of war, make requisitions upon the separate States for their quota of the money necessary for national expenses, regulate the value of coin, control the postal service, etc. As it had no power to enforce its laws upon the States, it soon fell into contempt, and on March 4th, 1789, expired by limitation under the provisions of the present Constitution.—New England Confederation, the union effected by the colonies of Massachusetts Bay, Plymouth, Connecticut, and New Haven in 1643, suggested by the need of a common defense against the Dutch and the Indians. It was discontinued in 1684.=Syn. Confederation, Confederation, Confederation, Confederation, Senderation as follows: Both designate a union of distinct states. In a federation, however, the essential sovereignty, as exercised toward foreign countries, is regarded as irrevocably deposited in the hands of the central government, and only a constitutionally limited autonomy in internal matters is retained by the constituent territories; while in a confederation the sovereignty may be conceived as still existing in the constituents and exercised more or less extensively by the general government as delegated agent: a confederation. Hampton Court Conference, a conference appointed
by James I., at Hampton Court, in 1604, to settle the
disputes between the Furitan party and the High-church
party in the Church of England. It was conducted on three
days (January 14th, 16th, and 18th), and resulted in a few
siterations of the liturgy, but entirely failed to secure the
objects sought by the Puritans. An important indirect
result of it was the revision of the Bible called the King
James or authorized version, which was suggested at that
time.—Savoy Conference, a conference held at the Savoy
palace in London, after the restoration of Charles II. (1661),

At a very early period, for gross apostasy or other public sins, public confession was required as a condition precedent to partaking of the communion. Public confession was first made universally obligatory in the West as a condition of admission to communion by the fourth Lateran Council in A. D. 1215. It is now required in the Roman Catholic Church from all who are conscions of mortal slns, and is regarded as essential to absolution and divine pardon, and a necessary prerequisite to partaking of the communion. Priests are bound in the strongest manner never to disclose a secret thus confided to them. Confession ls obligatory in the Orthodox Greek and in the Armenian Church. The An

Confident person, in Scots law, a partner in trade; a factor, steward, or confidential man of business; also, a servant or other dependant. —Syn. 1. Sure, Certain, Confident, Ponitire, Dogmatic. Sure is the simplest and most general of these words; it has the strength of simplicity. Certain suggests the idea of having been freed from doubt, having been made sure. Confident belongs especially in the field of reliant action: as, he is confident of success. In regard to opinion or belief it may mean no more than sure, or it may suggest reliance, as on one's own judgment or upon evidence: as, a confident expectation, hope, belief. It implies a desire for that of which one is confident. Positire runs close to over-confidence or dogmatism: as, he was positive that he had made no mistake; it expresses emphatic certainty that will not entertain a doubt of its correctness. (For dogmatic, see magisterial.) That confident and positive depend somewhat upon the will, and not mercly, like sure and certain, upon the understanding, is shown by the fact that it is not correct to say "I will not be certain, or sure, about this," while it is correct to say "I will not be positive, or confident, about it."

(d) The act of rendering valid or ratifying, especially by formal assent of the final or sovereign authority, or by action of a coordinate authority (as the United States Senate): as, the confirmation of an appointment, or of a grant, treaty, promise, escenant, stipulation, or agreement. (e) Eccles.: (1) A rite whereby baptized persons are admitted to full communion with the church. In the Roman Catholic, Greek, and Anglican churches it consists of the imposition of hands and prayer by a bishop (or in the Greek Church by episcopal authority), preceded in the two former by unctien or anointing with chrism. In the first two churches it is regarded as the confirming or strengthening of the Spirit. In the Anglican Church, high-churchmen and low-churchmen regard it from different points of view, the latter attaching especial importance to the personal renewal made in it, by the persons confirmed, of the vows taken by others in their name at baptism, while the former believe it to be essentially a sacramental rite, conveying the strengthening power of the Holy Ghost. This rite is believed to be recorded in the New Testament as a laying on of hands following baptism, distinct from ordination, and administered by aposites only. Unction was discontinued in the Anglican Church not long after the Reformation. In the early church confirmation immediately followed baptism, and the Greek Church has always retained this practice; in the West, however, the two have been separated since the thirteenth century by an interval of seven years or more. Formerly confirmation was sometimes allowed to be administered by presbyters if authorized by the bishop; and this is still the case in the Greek Church, where it is administered by presbyters if authorized by the bishop; and this is still the case in the Greek Church, where it is administered by priests with chrism consecrated by a

Suppose that a given line of a copy has been affected by some scribe's stupidity, so as materially to change the sense without affecting the length (as by the substitution of two or three letters from a wrong line), and that by the subsequent correction of the passage two readings have been placed in close relation, it frequently happens that the real line and the erroneous line which is equal in length to it both combine to form a new reading, which has thus increased the text by one of its own lines. This phenomenon is known by the name of conflation. C.), who, by their virtue and the force of their individual character, were said to have removed evil, poverty, and ignorance from the empire. The system of Confucius was essentially mundane in its methods and aims, being based upon the proper discharge of the duties involved in the five relationships of life, namely, those of prince and subject, parent and child, brother and brother, husband and wife, and friend and friend. By many Confucianism is called one of the three religions of China, the others being Taoism and Buddhism. In this sense the term includes both the Confucian scheme of ethics and stateeraft and the ancient native religion (for

which the name Sinism has been proposed) existent in China from the dawn of Chinese history, and still observed as the state religion. Its chief features are: (1) the worship of the Supreme Being (Shang-ti) by the emperor on behalf of the people; (2) the worship of "the host of spirits," as the gods of the winds, of the rivers, of the mountains, the grain, etc., by the officials and dignitaries; and (3) the observance of ancestral worship and filial piety by all. (See Sinism.) By others the term has been still further extended, so as to include the cosmogonic speculations of Chu-hi and the other speculative philesophers of the twelfth century. The only Chinese term corresponding in any degree to the word Confucianism is Yu-Klao, 'the system of the learned.'

system of the learned.

Confucianism pure and simple is in our opinion no religion at all. The essence of Confucianism is an antiquarian adherence to traditional forms of etiquette—taking the place of ethics; a sceptic denial of any relation between man and a living God—taking the place of religion; while there is encouraged a sort of worship of human genius, combined with a set of despetic political theories. But who can honestly call this a religion? China Rev., VIII. So

I use the term Confucianism . . . as covering, first of all, the ancient religion of China, and then the views of the great philosopher himself, in illustration or modification of it.

Congre, conger (of congruere, L., to agree together), a society of booksellers who have a joint stock in trade or agree to print books in copartnership.

Bailey, 1733.

In American slang it [congers] indicates, according to the same writer [Mr. A. Hall], a company of publishers who keep all the advantages to themselves in a particular book, and shut out their brethren of the trade from such. It has been used in a somewhat similar sense in this country for a long period, as all students of the literary history of the last century know. The fourth edition of Dr. Wells's "Antient and Modern Geography" was published by an association of booksellers who, about 1719, entered his an especial partnership for the purpose of printing some expensive works, and styled themselves "The Printing Conger."

As a broad general rule, nearly every post-Reformation institute is styled, not an "Order," but a "Congregation"; but the only distinction which can be drawn between these two names is that "order" is the wider, and may include several congregations within itself (as the Benedictine order, for example, includes the congregations of Cluny and of St. Maur), while a congregation is a simple unit, com-

plete in itself, and neither dependent on another institute nor possessed of dependent varieties of its own, *Encyc. Brit.*, XVI. 715.

congregationalism (kong-grē-gā'shon-al-izm), n. [< congregational + -ism.] 1. A system of church government based upon the autonomy of the individual congregation. It embodies three church government based upon the autonomy of the individual congregation. It embodies three fundamental principles—(1) that it is the right and duty of believers in Jesus Christ in every community to organize for Christian work and worship, and that such an organization is a Christian ehureh; (2) that each such church is by right independent of all external ecclesiastical control, and in any such church all members possess equal ecclesiastical authority; (3) that such churches owe a duty of Christian fellowship and cooperation to one another. This fellowship and ecoperation is exercised among those who bear the name of Congregationalists by means of councils, conferences, consociations, and associations. The principles of congregationalism are maintained not only by Congregationalists, and some other denominations of Christians, and by many evangelical churches in France, Switzerland, etc.

Congregationalism is the democratic form of church or-

Switzerland, etc.

Congregationalism is the democratic form of church order and government; it derives its name from the prominence which it gives to the congregation of Christian believers. It vests all ecclesiastical power (under Christ) in the associated brotherhood of each local church, as an independent body. At the same time it recognizes a fraternal and equal fellowship between these independent churches, which invests each with the right and duty of advice and reproof, and even of the public withdrawal of that fellowship in case the course pursued by another of the sisterhood should demand such action for the preservation of its own purity and consistency. Herein Congregationalism as a system differs from Independency, which affirms the seat of ecclesiastical power to reside in the brotherhood so zealously as to ignore any check, even of advice, upon its action. advice, upon its action.

2. [cap.] One of a denomination of Christians who hold to the congregational principle of church government, to the system of doctrines known as evangelical or orthodox, to the legitimacy of the baptism of infants, and to baptism by sprinkling. The Congregationalists of the United States are identical in origin and general principles with the Independents (now also called Congregationalists) of Great Britain. They were the predominent religious body in the first settlement of New England, and have thence spread over the United States, especially in the Northern and Middle States. Their churches are independent of one another; their various ecclesiastical sysemblies—councils, conferences, consociations, associations—possess no ecclesiastical authority, but only a moral power; and they are generally moderate Calvinists in theological doctrines. Their missionary operations are carried on by means of voluntary societies supported by the churches, but only indirectly smenable to them.

(b) The Congress of the Confederation, March 1st, 1781. (b) The Congress of the Confederation, March 1st, 1781. to March 4th, 1789. (c) The Congress of the United States under the Articles of Confederation, March 1st, 1781. to March 4th, 1789. (c) The Congress of the United States, which represents both the States and the people under the Constitution, and which met for the first time March 4th, 1789. It consists of two houses, the Senate and House of Representatives (sometimes called the upper and lower houses), and meets at least once every year. The Senate is composed of two members from each State, elected (by its legislature) for a period of six years, one third of them being elected every second year. The number of representatives varies in each State in proportion to the population. (See apportionment, 2.) They sit for two years only. The united body, for the two years during which the representatives hold their seats, receives a numerical designation as a single Congress, counting from the first. Thus, the senators and representatives sitting during the period March 4th, 1889, constituted the 50th Congress. The degenerate form of the hyperbola is a pair of straight lines, as shown in fig. 1. Fig. 2 shows the circle as a special case of the ellipse having no special relations to the infinitely distant part of the real plane, though it passes through two fixed imaginary points on the line at infinity.

the cone on the other side of the vertex (fig. 5), and the twofold curve thus generated is a haperbola. A particular case of the hyperbola, produced when the plane passes through the vertex of the cone, is that of two intersecting straight lines, called a degenerate conic. Intermediate between the ellipse and the hyperbola is the case where the plane is parallel to the side of the cone (fig. 4), and the curve thus produced is a parabola. The degenerate form of the ellipse is a point, that of the parabola a straight line. The degenerate forms are not true conics, because they are of the first class, the conics being of the second class.—Spherical conic section, a curve produced by the intersection of a sphere with a cone.

Conical bearing. See bearing.—Conical gearing. See gearing.—Conical map-projection, the projection of the earth first upon a tangent or secant cone with the subsequent development of the cone. The best-known conical projection is Bonne's, used for the map of France. "In constructing a map on this projection, a central meridian and a central parallel are first assumed. A cone, tangent along the central parallel, is then assumed, and the central meridian developed along that generator of the cone which is tangent to it, and the cone is then developed on a tangent plane. The parallel falls into an arc of a circle with its center at the vertex, and the meridian becomes a graduated right line. Concentric circles are then conceived to be traced through points of this meridian at elementary distances along its length. The zones of the sphere lying between the parallels through these points are next conceived to be developed, each between its corresponding parallels. Thus all the parallel zones of the sphere are rolled out on a plane in their true relations to each other and to the central meridian, each having in projection the same width, length, and relation to the neighboring zones as on the spheroidal surface. As there are no openings between consecutive development. Each meridian of the projection is so traced as to cut each parallel in the same point in which it intersected it on the sphere." Craig, Treatise on Projections, p. 72.—Conical point, in geom., an point on a surface such that every line through it meets the surface in two coincident points.—Conical pupæ or chrysalides, in entom, those pupæ or chrysalides and are more or less conical in form.

Coniferæ (kō-nif'e-rē), n. pl. [NL., fem. pl. of L. conifer, cone-bearing: see conifer.] The principal order of gymnospermous exogens, exceeding every other order in the value of its timbercipal order of gymnospermous exogens, exceeding every other order in the value of its timbersupply and of its resinous products. It is cosmopolitan, but is especially abundant in temperate and mountainous regions, often forming in the northern hemisphere vast forests. It eonists of trees or shruhs, mostly evergreen and resinous, usually with subulate (awl-shaped), needle-shaped, or seale-like rigid leaves, and with momecious or rarely directious naked flowers. The male thower consists of an indefinite number of stamens upon a central axis, the anthers being frequently suspended from the under side of a peltate scale. The fertile ament consists of scales bearing naked ovules, and in fruit becomes a dry cone or is fleshy and drupe-like. The embryo has often several cotyledons in a whord. The wood, as in all gymnosperms, is characterized by having the sides of the cells dotted with what are called bordered pits or discoid markings. The order includes 32 genera and about 300 species, and is divided into the following tribes: (a) Abictineae, bearing cones formed of spirally imbricated two-seeded scales; to this belong the pine, fir, spruce, larch, cedar, etc. (b) Araucarieae, with similar cones having one or several seeds to each scale, represented by Araucaria and Ayathis in the southern hemisphere, and by two monotypleal genera in China and Japan. (c) Podocarpeae, likewise of the sonthern hemisphere and eastern Asia. (d) Taxodineae, including the big-tree of California (Sequoia), the bald cypress(Taxodium), and a few species of Australia and Japan. (e) Cupressineae, having cones with decussately opposite scales, or sometimes drupe-like, as the cypress, juniper, arbor-vite, and the North American cedars. (f) Taxod with fruit consisting usually of a single seed surrounded by a fleshy disk or eoat. This tribe is by some considered a separate order, and includes the yew (Taxus), Torreya, the ginkgo of Chioa, and some other small genera of Australia and Australasia. Carboniferous measures, and continue upward through all subsequent formations.

=Syn. Imagine. Conjecture, Surmise, Guess, Presume, fancy, divine. Imagine literally expresses pure speculation, and figuratively expresses an idea founded upon the slightest evidence: as, I imagine that you will find yourself mistaken. Conjecture is something like a random throw of the mind; it turns from one possibility to another, and perhaps selects one, almost arbitrarily. Surmise has often the same sense as conjecture; it sometimes implies a suspleion, favorable or otherwise: as, I surmise that his motives were not good. Guess suggests a riddle, the solution of which is felt after by the mind—a question, as to which we offer an opinion, but not with confience, because the material for a judgment is confessedly insufficient. To presume is to base a tentative or provisional opinion on such knowledge as one has, to be held until it is modified or overthrown by further information.

development of new individuals. It is also called zygosis, and the resulting blended organism is called a zygote or zygospore. The process occurs only in the lower animals and plants, among many of which it is an ordinary mode of reproduction. It is very common in protozoans, and has been observed in certain worms. (See Diplozoön.) A permanent fusion takes place in the unicellular algae Diatomacea and Desmidiaceae by the union of the contents of two asparate cells; in the Zygnemaceae and Mesocarpee, by that of two cells of different filaments or of the same filament; and in the Zoösporee, by that of zoöspores from different mother-cells. The result of the union in each case is called a zygospore; the latter produces a plant alm-

ilar to that from which it came. The process is considered a sexual one, though the cells which unite cannot be distinguished as male and female.

The conjugation of the Algæ and of some of the simplest animals is the first step towards sexual reproduction. Darwin, Cross and Self Fertilisation, p. 409.

Darwin, Cross and Self Fertilisation, p. 409.

The conjugation of two Infusoria occurs in very different ways, and leads to more or less complete fusion, which, after regeneration of the nucleus, is followed by an increase in the frequency of fission. Paramoechan, Stentor, Spirostoma, during conjugation, become connected by their ventral surfaces; other Infusoria, with a flat body like Oxytrichina or Chilodon, by their sides; while Enchelys, Halteria, Colepa, join together the anterior extremities of their bodies, giving the appearance of transverse fission. A lateral conjugation also takes place not infrequently in Vorticella, Trichodina, etc., between individuals of unequal size, the smaller one having the appearance of a bud.

In anat., the mucous membrane which lines the inner surface of the eyelids and thence is reflected over the front of the eyeball, thus conjoining the lids and the globe of the eye: a contraction of tunica conjunctiva. In low vertebrates it is indimentary and non-secretory, or not to be demonstrated; in the higher vertebrates which have cyclids it is well defined. In birds and many reptiles and manumals it forms a special fold, chiefly constituting the nictitating membrane or third cyclid. It is very delicate where it passes over the cornea, offering no impediment to vision. In snakes which have no cyclids a delicate cuttele continues from the skin over the eye, and is shed with the rest of the cutiele. The membrane is regarded as one of the tunics or coats of the cyclail, like the tunica scierotica, etc.

[The Latin equivalent convotativus is frequent in the scholastic writers, from Alexander of Hales, one of the earliest, who gives relativa appellatio as the equivalent of nomen connotans, to William of Occam, who says: "A connotative name is that which signifies one thing primarily and another secondarily; and such a name properly has a nominal definition... and frequently a part of that definition outglit to be placed in the nominative and part in an oblique case, ... as with the noun white, ... that which possesses whiteness." The word is used in this sense in older English writers. Several modern writers, as James Mill, have used it in nearly the same way; but J. S. Mill's influence has established, alongside of the old meaning, another, used by his followers, which is defined in the following extract:

A connotative term is one which denotes a subject, and notes anything, in whatever sense those verbs

In the following extract:

A connotative term is one which denotes a subject, and implies an attribute. By a subject is here meant anything which possesses attributes. Thus John, or London, or Enghald, are names which signify a subject only. Whiteness, length, virtue, signify an attribute only. None of these names, therefore, are connotative. But white, long, virtuous are connotative. The word white denotes all white things, as snow, paper, the foam of the sea, etc., and timplies, or, as it was termed by the schoolmen, connotes, the attribute whiteness.

It [Cosmos] denotes the entire phenomenal universe; it connotes the orderly uniformity of nature, and the negation of miracle or extraneous disturbance of any kind.

J. Fiske, Cosmic Philos., I. 182.

[This meaning was introduced by J. S. Mill. A word connotes those attributes which its predication of a subject asserts that that subject possesses. But connote is now often loosely used in such a sense that any attribute known to be possessed by all the objects denoted by a term is said to be connoted by that term. Mill discountenances this use of the word.

this use of the word.

In some cases it is not easy to decide precisely how much a particular word does or does not comnote; that is, we do not exactly know (the case not having arisen) what degree of difference in the object would occasion a difference in the name. Thus, it is clear that the word man, besides animal life and rationality, connotes also a certain external form; but it would be impossible to say precisely what form; that is, to decide how great a deviation from the form ordinarily found in the beings whom we are accustomed to call men would suffice in a newly discovered race to make us refuse them the name of man.

J. S. Mill, Logic, 1, ii. § 5.

= Syn, Note, Denote, Connote. See the definitions of these

# KEY TO PRONUNCIATION.

8	
ā	
ä	
a	as in fall, talk, naught.
A	
ă	
e	
ē	as in mete, meet, meat,
ě	as in her, fern, heard.
i	as in pin, it, biscuit.
I	as in pine, fight, file.
0	as in not, on, frog.
ŏ	as in note, poke, floor.
ö	as in move, apoon, room,
٥	as in nor, song, off.
u	as in tub, son, blood.
û	as in mute, acute, few (also new
ů	tube, duty: see Preface, pp. ix, x). as in pull, book, could.

ii German ii, French u.
oi as in oll, joint, boy.
ou as in pound, proud, now.

A single dot under a vowel in an unaccented syllable indicates its abbreviation and lightening, without absolute loss of its distinctive quality. See Preface, p. xi. Thus:

ā as în prelate, courage, captain. ē as în ablegate, episcopal. ō as in abrogate, eulogy, democrat. ū as în singular, education.

A double dot under a vowel in an unaccented syllable indicates that, even in the mouths of the best speakers, its sound is variable to, and in ordinary utterance actually becomes, the short u-sound (of but, pun, etc.). See Preface, p. xl. Thus:

as in errant, republican.
as in prudent, difference.
as in charity, density.
as in valor, actor, idiot.
as in Persia, peninsula.
as in the book.
as in nature, feature.

A mark (-) under the consonants t, d, s, z indicates that they in like manner are variable to ch, j, sh, zh. Thus:

t as in nature, adventure.
d as in arduous, education.
s as in leisure.
s as in aeixure.

th as in thin.
TH as in then.
ch as in German ach, Seoteh loch.
f French nasalixing n, as in ton, en.

ly (in French words) French liquid (mou-illé) 1.
'denotes a primary," a secondary accent. (A secondary accent is not marked if at its regular interval of two syllables from the primary, or from another secondary.)

### SIGNS.
